

# Notas profe Marco

```
private List<UserRepo> loadDataBase() {  
    List<UserRepo> users = null;  
    File file;  
    ObjectMapper objectMapper = new ObjectMapper()  
        .configure(SerializationFeature.WRAP_ROOT_VALUE, false)  
        .registerModule(new JavaTimeModule());  
    TypeReference<List<UserRepo>> typeRef = new TypeReference<>() {};  
  
    try {  
        file = ResourceUtils.getFile("classpath:json/users.json");  
        users = objectMapper.readValue(file, typeRef);  
    } catch (IOException e) {  
        e.printStackTrace();  
    }  
  
    return users;  
}
```

Esto es para convertir un json en una lista de objetos de model

@JsonFormat(pattern = "dd-MM-yyyy HH:mm:ss", shape =  
JsonFormat.Shape.STRING)

Por si lo necesitan, pueden usar @RequestParam(required = false) si hay algún  
parámetro opcional .
